

TABLES

Table 2.1: Summary of the techniques used to analyse the mechanical (MP), physicochemical (PCP), and optical properties (OP) of the aged materials **60**

Table 3.1: Summary of mechanical properties and production costs for the selected plastic as candidate materials for manufacturing SODIS devices **85**

Table 3.2: Summary of the results obtained from the tests carried out to analyse the characteristics of the aged materials **86**

Table 3.3: Absorption (κ) and scattering (φ) coefficients and the g parameter of the Henyey–Greenstein scattering phase function for solids, dissolved iron, and humic acids **92**

Table 3.4: Average incident radiation and uniformity index in the volume of the high–volume container as a function of iron or humic acids (HA) concentration **93**

Table 3.5: Average incident radiation and uniformity index in the volume of the high–volume container as a function of solids concentration **93**

Table 3.6: Mechanisms of the cell’s respiration pathways and bacterial inactivation routes by radical’s damage and thermal effect. In bold: kinetic parameters estimated in this work **107**

Table 3.7: Mechanism of the H₂O₂ decomposition and its consumption when added to water inoculated with *E. coli*. In bold: kinetic parameters estimated in this work **109**
